

Business.Helpers.Response

Плагин Business.Helpers.Response служит утилитой для стандартизации ответов API в бизнес-приложениях. Его основная цель - упростить создание последовательных и структурированных ответов для различных сценариев, возникающих во время взаимодействия с API.

```
/**
 * Prepares and returns an API response object for a failed operation.
 * This should be used when an operation does not complete successfully,
 * with the provided error message included in the response.
 *
 * @param {string} errorMessage - The error message to be included in the response.
 * @returns {Object} An object representing a failed operation response.
 */
function getErrorResponse(errorMessage) {
    return {
        success: false,
        message: errorMessage
    };
}

/**
 * Prepares and returns an API response object for a successful operation.
 * This should be used when an operation completes successfully
 * and no additional data needs to be returned.
 *
 * @returns {Object} An object representing a successful operation response.
 */
function getSuccessResponse() {
    return {
        success: true
    };
}

/**
 * Prepares and returns an API response object for a successful operation
 * with additional JSON data. This should be used when an operation completes
```

```
* successfully and there is additional data to return in the response.
*
* @param {Object} json - The JSON data to be included in the response.
* @returns {Object} An object representing a successful operation response with additional
data.
*/
function getSuccessResponseWithJson(json) {
  return {
    ...json,
    success: true
  }
}
```
